                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 OBM is isolated from stroma cells cultured in the presence of a bone absorption factor by separation and solubilisation of membrane proteins then affinity chromatography using OCIF. It exists in a full-sequence form and a solubilised form (sOBM) which is a shorter chain. OBM may be used for screening potential inhibitors and modifiers of its biological activity, and screening for receptors to OBM which mediate its function. These substances can then be used in the treatment of disorders of bone function and calcium metabolism. The antibodies can be used for assay of the protein, for investigative and diagnostic nurrocan.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     components
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents an osteoclastogenesis inhibitory fact (OCIF)-binding molecule (OBM). The protein promotes and supports the separation and maturation of osteoclasts in the presence of bone absorption factors such as calcitriol or parathyroid hormone (PTH).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 28; Pages 119-120; 151pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     detection of ord binding protein) and to identify compounds that modulate binding of OPG binding protein to osteoclast differentiation and activation receptor (ODAR). The nucleic acid molecule encoding oPG binding protein can be used to detect OPG binding protein-encoding sequences, e.g. screening for related sequences, also to produce transgenic animal models, while complementary sequences are used for antisense regulation of OPG binding protein expression. Modulators of OPG binding protein, particularly soluble forms of OPG binding protein or Ab, are used to treat or prevent bone diseases, e.g. osteoporosis, bone loss caused by arthritis or metastases, hypercalcamenia, Paget's disease, periodontal disease, osteoporosis, loosening of prostheses, optionally in combination with agents that promote bone growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is human osteoprotegerin (OPG) binding protein. Host cells transfected with vectors containing nucleic acid molecules encoding OPG binding protein are used to produce recombinant OPG binding protein is used in binding assays to determine osteoprotegrin (OG) in biological samples; to screen for specific binding agents (particularly agonists and antagonists, including intracellular proteins); to raise Ab (useful in immunoassays for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents an osteoclastogenesis inhibitory factor (OCIF)-binding molecule (OBM). The protein promotes and supports the separation and maturation of osteoclasts in the presence of bone absorption factors such as calcitriol or parathyroid hormone (PTH). OBM is isolated from stroma cells cultured in the presence of a bone absorption factor by separation and solubilisation of membrane proteins then affinity chromatography using OCIF. It exists in a full-sequence form and a solubilised form (gOBM) which is a shorter chain. OBM may be used for screening for receptors to OBM which mediate its function. These substances can then be used in the treatment of disorders of bone function and calcium metabolism. The antibodies can be used for assay of the protein, for investigative and diagnostic purposes, and as components of drugs.

allo-stimulatory capacity, thereby augmenting an immune response. The soluble RANK polypeptide composition may also be used for regulating an immune or inflammatory response. Inhibition of NF-KB by RANK antagonists may be useful in ameliorating negative effects of an inflammatory response that result from triggering of RANK, e.g. in treating toxic shock or sepsis, graft-versus-host reactions, or acute inflammatory reactions. They can also be used in adjunct therapy for disease characterised by neoplastic cells that express RANK. RANKL polypeptides can also be used to identify inhibitors of RANK and thus inhibitors of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This represents a human RANKL, a ligand for the RANK (receptor activator of necrosis factor-kappaB (NF-kB) polypeptide. RANK is a member of the tunour necrosis factor (TNF) family. A soluble RANK may be used for inhibiting activation of NF-kB, by contacting a cell expressing membrane-associated RANK with a soluble RANK which binds tRANK ligand (RANKL). RANKL polypeptides can activate RANK and can be used to induce maturation of dendritic cells and enhance their
                                                                                                                               RANK; necrosis factor-kappa B; NF-kB; receptor activator; immune response; inflammatory response; toxic shock; seps: RANKL; RANK ligand; tumour necrosis factor; TNF.
                                                                                                                                                                                                                                                                   NF-kB receptor activator RANK ligand (RANKL).
                                                                                                                                                                                                                                                                                                                                        08-OCT-1998

RANK is a member of the tumour necrosis factor (TNF) family. Host cells transformed or transfected with an expression vector comprising the RANK encoding nucleic acid can be used to produce recombinant RANK protein. The soluble RANK may be used for inhibiting activation of NF-kB, by contacting a cell expressing membrane-associated RANK with a soluble RANK which binds to RANK ligand (RANKL). The soluble RANK with a soluble composition may also be used for regulating an immune or inflammatory response, inhibition of NF-kB by RANK antagonists may be useful in ameliorating negative effects of an inflammatory response that result from triggering of RANK, e.g. in treating toxic shock or sepsis, graft-versus-host reactions, or acute inflammatory reactions. They can also be used in adjunct therapy for alsease characterised by neoplastic cells that express RANK. The products

Osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II transmembrane protein. The murine and human OPGL polypeptides are 87% homologous. OPGL is a potent osteoclast differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OPGL is also an activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of OPGL activity in an animal. The method comprises using at least one OPGL polypeptide or subsequence, and/or at least one OPGL analogue to induce an immune response in the animal. The method and OPGL polypeptide are useful for treating, preventing and ameliorating osteoporosis or other diseases or conditions characterised by excessive bone resorption.

CC are useful for regulating immune response and in screening for inhibitors of these receptors. The cytoplasmic domain of RANK is used in developing cassays for inhibitors of signal transduction, e.g. for screening for inhibitors of molecules that inhibit interaction of RANK with TRAFI, TRAF2, TRAF3, CC are useful in ameliorating the negative effects of an inflammatory cresponse that result from triggering of RANK, e.g. in treating toxic response that result from triggering of RANK, e.g. in treating toxic casponse that result from triggering of RANK, e.g. in treating toxic reactions and the effects of bone resorption. RANK acts as an anticorputor signal and rescue the cells that express RANK from apoptosis. Screening tests for agonists or antagonists of RANK activity, as creening tests for agonists or antagonists of RANK activity, as careuseful of a signal via RANK. RANK composition, or to inhibit capress rank. Compounds that interfere with RANK/TRAF6 interactions are used in the capress RANK. Compounds that interfere with RANK/TRAF6 interactions care useful for modulating osteoclast function and activities. They care used as inhibitors of diseases associated with excess bone resorption and as immunosuppressants or anti-inflammatory agents. The RANK DNAs are useful in preparing kits for the detection of soluble RANK, or compounds that for the detection of soluble RANK, or compounds that for the detection of soluble RANK, or compounds the formation from the prosence or distribution of the detection of soluble RANK, or compounds the formation for soluble RANK, or compounds the formation of soluble RANK, or compounds the formation from the detection of soluble RANK is and constant process or compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The patent discloses novel receptor activator of nuclear factor (NF)-
kappaB (RANK) proteins and their corresponding DNAs. RANK is a member
of the tumour necrosis factor (TNF) receptor superfamily and associates
with TNF receptor associated factor (TRAF) 2 and 3 which are important
in the regulation of immune and inflammatory response. The receptors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       14-OCT-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to receptor activator of NF-chi B (RANK) DNA. RANK is mapped to chromosome 18q22.1 and its ligand (RANKL) to chromosome 13q14. RANK and RANKL are type 1 and type 2 transmembrane proteins respectively. RANK is a member of the tumour necrosis factor (TNF) superfamily and it closely resembles CD40 in the extracellular region. RANK associates with TNF receptor-associated factor (TRAF) 2 and TRAF3. The DNA molecules are useful for producing ligands of RANK. The ligands are useful for regulating immune response and in screening for inhibitors of RANK. The present sequence is human RANKL (huRANKL)

                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a novel receptor, referred to as RANK CC (receptor activator of NF (nuclear factor)-kappaB), a member of TNF CC (tumour necrosis factor) receptor superfamily. RANK is a Type I CC transmembrane protein that interacts with TNF receptor-associated CC factors (TRAFS). Triggering of RANK by overexpression or co-expression CC of RANK and membrane bound RANK ligand (RANKL) results in upregulation CC of the transcription factor NF-kappaB, a ubiquitous transcription factor CC that is most extensively utilised in cells of the immune system. CC Inhibition of NF-kappaB by RANK antagonists is useful in ameliorating CC negative effects of inflammatory reactions, and the effects of excess bone resorption. The RANK DNAs, proteins and their analogues are useful CC for the preparation of pharmaceutical compositions, for infecting target CC cells for use in gene therapy applications in diagnosing diseases CC associated with RANK, and as targets for use in screening assays. They can be used in the treatment or diagnosis of immune system dysfunction.
                                                                                                                                                             Matches
                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                            The present invention also encompasses gene therapy methods to correct gene-activating mutations, associated with e.g. familial expansile osteolysis (FEO) and early onset Paget's disease of bone (EP). The present amino acid sequence is full-length human RANKL (hurankl) protein. The RANKL gene is located in chromosome 13q14.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; receptor activator of NF-kappaB; RANK; nuclear factor-kappaB; NF-kappaB; tumour necrosis factor; TNF; type I transmembrane protein; TNF receptor-associated factor; TRAF; RANK ligand; RANKL; osteopathic; inflammatory reaction; bone resorption; gene therapy; immunomodulator; immune system dysfunction; familial expansile osteolysis; FEO; early onset Paget's disease of bone; EP; cytostatic; chromosome 13q14.

pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                US-09-880-457-1_COPY_543_746

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Zuechtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany This sequence is recovered from the left border of the T-DNA. It indicates an insertion within the locus defined by clone MCL19. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI'. Information on line availability can be found at:

Arabidopsis thaliana T-DNA mutagenised population (GABI-Kat)
                                                                                                         D
                                                                                                                                             /note-TCR was performed on DNA from Arabidopsis thaliana plants (T1) which were transformed with the T-DNA from vector pAc161. The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion. Sequences displaying significant similarity to the A. thalaina nuclear genome sequence were processed for submission. T-DNA derived sequences were
                                                                                                         removed"

An Arabidopsis full-length cDNA library was constructed essentially
as reported previously (Seki et al., 1998).cDNA cleaved with BamHI
and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et
al., submitted for publication) digested with BamHI and SalI. This
clone is in a modified pBluescript vector. Please visit our web
site (http://www.gsc.riken.go.jp/e/plant/index_e.html) for further
details.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                   Score

The sequences of the 122 PRO polynucleotides CC encode human secreted proteins. The PRO nucleic acids, polypeptides, CC The PRO polypeptides are useful for treating a PRO related disorder. CC cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or CC civer tumour. The PRO polypeptides are useful for stimulating the CC the proliferation of, or gene expression, in pericyte cells, for stimulating the CC the proliferation or differentiation of chondrocyte cells, for CC concern the PRO polypeptides are useful for stimulating the CC the proliferation or differentiation of chondrocyte cells, for CC concern the proliferation of chondrocyte cells, for CC concern the proliferation of chondrocyte cells, for CC concern the proliferation of comman human blood, CC concern the proliferation of comman human dermal CC concern the proliferation of comman management that the proliferation of comman management the proliferation of comman

The present sequence encodes an osteoclastogenesis inhibitory factor (OCLF) binding molecule (OBM). The protein promotes and supports the separation and maturation of osteoclasts in the presence of bone obsorption factors such as calcitriol or parathyroid hormone (PTH). The protein factor by separation and solubilisation of membrane proteins then affinity chromatography using OCLF. It exists in a full-sequence used for screening potential inhibitors and modifiers of its biological These substances can then be used in the treatment of disorders of bone of the protein, for investigative and diagnostic purposes, and as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WO9846644-A1
                                       (OCIF)-binding molecule (OBM). The protein promotes and supports the separation and maturation of osteoclasts in the presence of bone absorption factors such as calcitriol or parathyroid hormone (PTH). By a solubilized from stroma cells cultured in the presence of a bone absorption factor by separation and solubilisation of membrane proteins absorption factor by separation and solubilisation of membrane proteins absorption actoring form (sobm) which is a shorter chain. OBM may be form and a solubilised form (sobm) which is a shorter chain. OBM may be used for screening potential inhibitors and modifiers of its biological used for screening for receptors to OBM which mediate its function. activity, and screening for receptors to OBM which mediate its function and calcium metabolism. The antibodies can be used for assay of the protein, for investigative and diagnostic purposes, and as

                                                        activator of necrosis factor kappaB (NF-kB)) polypeptide. RANK is a member of the tumour necrosis factor (TNF) family. A soluble RANK may be used for inhibiting activation of NF-kB, by contacting a cell may be used for inhibiting activation as soluble RANK which binds to expressing membrane-associated RANK not a soluble RANK and can be RANK ligand (RANKL). RANKL polypeptides can activate RANK and can be used to induce maturation of dendritic cells and enhance their
                                                                                                                                                                                                                                                     New isolated ligand for receptor activator of NF-kappa B - used to develop products for augmenting an immune response for inhibiting inflammatory response and for protection of cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAV41372;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             may be useful in ameliorating negative effects of an inflammatory response that result from triggering of RANK, e.g. in treating toxic shock or sepsis, graft-versus-host reactions, or acute inflammatory reactions. They can also be used in adjunct therapy for disease can also be used to identify inhibitors of RANK RANKL Polypeptides an inflammatory response, and also for protecting RANK-expressing cells from the negative effects of chemotherapy or the presence of high levels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC This cDNA encodes a human RANKL, a ligand for the RANK (receptor CC activator of necrosis factor kappab (NF-kB)) polypeptide. RANK is a CC member of the tumour necrosis factor (TNF) family. Host cells transformed CC nucleic acid can be used to produce recombinant RANK protein. The soluble CC RANK may be used for inhibiting activation of NF-kB, by contacting a cell CC expressing membrane-associated RANK with a soluble RANK which binds to CC used for regulating an immune or inflammatory response. Inhibition of CC Used for regulating an immune or inflammatory response. Inhibition of CC inflammatory response that result from triggering of RANK, e.g. in CC inflammatory response that result from triggering of RANK, e.g. in CC inflammatory reactions. They can also be used in adjunct therapy for can also he used to reactions or acute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches 137; Conservative

CC Rappab (RANK) proteins and their corresponding DNAs. RANK is a member of the tumour necrosis factor (TNF) receptor superfamily and associates con the regulation of immune and inflammatory response. The receptors care useful for regulating immune response and in screening for inhibitors of these receptors. The cytoplasmic domain of RANK is used in developing concludes that inhibit interaction of RANK with TRAF1, TRAF2, TRAF3, concludes that inhibit interaction of RANK with TRAF1, TRAF2, TRAF3, concludes that result from triggering of RANK, e.g. in treating toxic complex that result from triggering of RANK, e.g. in treating toxic response that result from triggering of RANK, e.g. in treating toxic consolves that result from triggering of RANK, e.g. in treating toxic consolves that result from triggering of RANK, e.g. in treating toxic response that result from triggering of RANK, e.g. in treating toxic consolves the result from triggering of RANK, e.g. in treating toxic response that result from triggering of RANK, e.g. in treating toxic consolves the result from triggering of RANK acts as an anticonstance of the receptor are used in vivo or in vitro based consolves and the effects of bone resorption. RANK acts as an anticonsolves are used as a signal via RANK, and compositions are used in the consolves and antagonists of RANK compositions are used in the consolves and antagonists of RANK compositions are used in the consolves and for modulating the formation of osteoclast from osteoclast consolves and for modulating osteoclast function and activities. They recurred and as immunosuppression of recombinant proteins, as probes for analysis useful for the expression of recombinant proteins, while the proteins care useful in preparing kits for the detection of soluble RANK, or and the presence or distribution of RANK transcripts, while the proteins are useful consolves and activities. The proteins are consolved activity. The present sequence is a cDNA encoding monitor RANK lightly consolved activity. The present s

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US6242213-B1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  05-JUN-2001
                                                                                                                                                                                                                                                                       The present invention relates to receptor activator of NF-chi B (RANK) DNA. RANK is mapped to chromosome 18q22.1 and its ligand (RANKL) to chromosome 13q14. RANK and RANKL are type 1 and type 2 transmembrane proteins respectively. RANK is a member of the tumour necrosis factor (TNF) superfamily and it closely resembles CD40 in the extracellular region. RANK associates with TNF receptor-associated factor (TRAP) 2 region. RANK associates with TNF receptor-associated factor (TRAP) 2 region. RANK associates with TNF receptor-associated factor (TRAP) 2 region. The DNA molecules are useful for producing ligands of RANK. The ligands are useful for regulating immune response and in screening for inhibitors of RANK. The present sequence is human RANKL (huranKL)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      23-DEC-1996;

CC The present invention relates to a novel receptor, referred to as RANK CC (receptor activator of NF (nuclear factor)-kappaB), a member of TNF (tumour necrosis factor) receptor superfamily. RANK is a Type I CC factors (TRAFs). Triggering of RANK by overexpression or co-expression CC of RANK and membrane bound RANK by overexpression or co-expression CC of the transcription factor NF-kappaB, a ubiquitous transcription factor CC that is most extensively utilised in cells of the ammune system.

CC inhibition of Nf-kappaB by RANK antagonists is useful in ameliorating cc negative effects of inflammatory reactions, and the effects of excess CC for the preparation. The RANK DNAs, proteins and their analogues are useful cc eals for use in gene therapy applications in diagnosing diseases CC may be used in the treatment or diagnosis of immune system dysfunction. The present invention also encompasses gene therapy methods to correct CC osteolysis (FEO) and early onset paget's disease of bone (FEO), The present-sequence is a cDNA encoding full-length human RANKL (hurannel).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAD05904

The method of the invention involves administering to the mammal a tumour necrosis factor-related activation induced cytokine (TRANCE) modulating agent. The method is useful for treating a mammal (TRANCE) modulating agent insufficient or excessive cartilage or skeletal growth, where the disorder comprising insufficient cartilage or skeletal growth is selected from dwarfism, osteopetrosis, cranifesom from the selected from dwarfism, osteopetrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       resulting from traumatic injury, surgery, osteoarthritis or rheumatoid arthritis, and disorders comprising excessive cartilage or skeletal growth are selected from acromegaly, gigantism, exostosis, carilaginea, exostosis bursata and multiple osteocartilaginous exostoses. The method is useful for inhibiting chondrocyte differentiation. The present nucleic acid sequence encodes the human TRANCE protein, splice variant 2, of the invention. TRANCE is a member of the tumour necrosis factor family and acts directly on cartilage-producing cells (chondrocytes).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating mammal having disorder characterised by abnormal cartilage/skeletal growth such as dwarfism, acromegaly, by administering tumour necrosis factor related activation induced

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the mammal a tumour necrosis factor related activation induced cytokine (TRANCE)-modulating agent. The method is useful for treating a mammal having a disorder comprising insufficient or excessive cartilage or skeletal growth where the disorder comprising insufficient cartilage or skeletal growth is selected from dwarfism, osteopetrosis, or skeletal discrepancies and bone or cartilage damage cranification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cartilage/skeletal growth such as dwarfism, acromegaly, by administering tumour necrosis factor related activation induced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating mammal having disorder characterised by abnormal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           resulting from traumatic injury surgery, osteoarthritis or rheumatoid arthritis, and disorders comprising excessive cartilage or skeletal growth are selected from acromegaly, gigantism, exostosis, carilaginea, growth are selected from acromegaly, gigantism, exostosis. The method exostosis bursata and multiple osteocartilaginous exostoses. The method is useful for inhibiting chondrocyte differentiation. The present nucleic acid sequence encodes the human TRANCE protein, splice variant nucleic acid sequence encodes the human TRANCE protein, splice variant 1, of the invention. TRANCE is a member of the tumour necrosis factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Fig 1; 55pp; English.

                                                                                                                                                                                                                                                                                                             protein. The murine and human OPGL polypeptides are 87% homologous. OPGL is a potent osteoclast differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OPGL is also an activator of mature osteoclasts. The of CSF-1. OPGL is also an activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of OPGL activity in an animal. The method comprises using at least one OPGL an immune response in the animal. The method and OPGL analogue to induce useful for treating, preventing and ameliorating osteoporosis or other animals.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence encodes a human osteoprotegerin ligand (OPGL). Osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II transmembrane

```
The present sequence encodes human osteoprotegerin (OPG) binding protein. CC encoding opg binding protein are used to produce recombinant OPG binding cC encoding opg binding protein is used in binding assays to determine CC osteoprotegrin (OG) in biological samples; to screen for specific contracellular proteins); to raise Ab (useful in immunoassays for CC intracellular proteins); to raise Ab (useful in immunoassays for CC modulate binding of OPG binding protein) and to identify compounds that CC and activation receptor (ODAR). The nucleic acid molecule encoding OPG contrasgenic animal models, while complementary sequences are used for CC sequences, e.g. screening for related sequences, also to produce transgenic animal models, while complementary sequences are used for CC OPG binding protein, particularly soluble forms of OPG binding protein binding protein, particularly soluble forms of OPG binding protein contrasted sease, periodontal disease, osteoporosis, lossening of prostheses, as optionally in combination with agents that promote bone growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the isolation of novel human PRO polypeptides and the polynucleotide sequences encoding them. The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other bladders such as neuronal, glial, astrocytal, hypothalamic, glandular, disorders such as neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, stromal and blastocelic disorders, inflammatory, immune and anglogenic disorders. The polynucleotide sequences are also useful in gene therapy. ABK40254-ABK40288 encode for the human PRO

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap clone sections. between neighboring data submissions. This sequence was finished as follows unless otherwise noted:

οy

all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence as compressions and repeats; all regions were covered by sequence than one subclone; and the assembly was confirmed by Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis McO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc restriction digest

The RPCI-II human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E., at a described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E., at a described a described at a finite described and improved paperoach for construction of bacterial artificial chromosome approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at the Roswell Park Cancer Institute The clone sequenced to the left is RP11-521D12. Actual start of this clone is at base position 1 of RP11-95D17; actual end is at base position 190748 of RP11-95D17. (http://bacpac.med.buffalo.edu)

There are polymorphic base differences between RP11-95D17 and the redundant clone AC062035. Data from AC062035 was used to finish RP11-95D17

Unresolved tandem repeat from base position 181200 to 187300. Size information from restriction digest suggests that the full repeat may not be represented.
